

Connecting Mobile Apple iOS Device to eduroam Wi-Fi

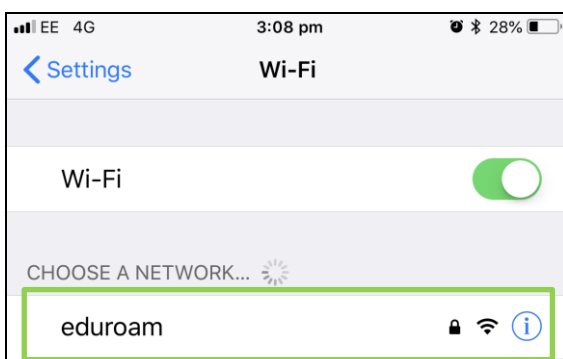

Below are instructions on how to connect your mobile Apple iOS device to the eduroam wireless network. For any other device please check that it supports 802.1x authentication - check the documentation that came with your device.

Please note: that some mobile phone vendors have removed some options and protocols from their devices which results in them not being configurable for eduroam. If you cannot see the options described on this page, your device may not work with eduroam.

1. Open Settings / Wi-Fi and turn Wi-Fi on

2. Now click on eduroam and connect.

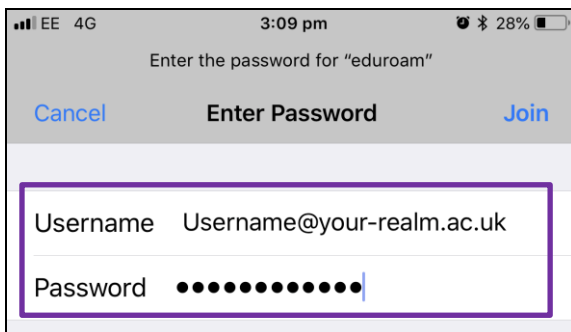

3. In the **"Username"** field, enter your **Username@your-realm.ac.uk** (this is your college/university email address)

If you are a member of **staff** at South Thames College or Merton College your username will be: **firstname.lastname@south-thames.ac.uk** (please **do not** use @stcg.ac.uk, this does not yet work).

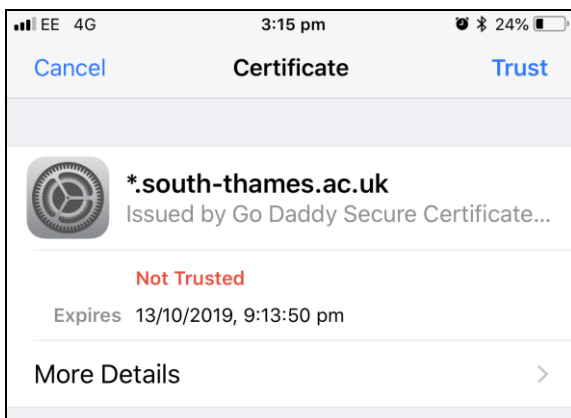

If you are a **student** at South Thames College or Merton College your username will be: **studentID@student.south-thames.ac.uk**

If you are employed/attend any other college/university with a **.ac.uk** address, please use those details.

4. Now enter your college/university **password**
5. Then click on **"Join"**.

6. You will now be presented with our certificate.
7. Click **"Trust"**

8. You should now see **eduroam ticked** in the list of wireless networks.
9. You are now **connected**.

Please note: When your college/university password expires you will need to change your password on a PC at your college/university. You will then have to re-enter the new password into the eduroam Wi-Fi settings and click connect again.
